

ACHIEVE A GENTLE SELECTIVE DISSECTION

CADISS®

Innovative surgical device for the selective weakening of the adhesions between pathological and healthy tissues.

CADISS® BENEFITS

TISSUE SEPARATION

ALLOW TO CREATE A CLEAVAGE PLANE.

TISSUE PRESERVATION

PRESERVE CRITICAL MICROSTRUCTURES (VESSELS, NERVES).
AVOID SKIN NECROSIS.

TISSUE CLEANING

NO FIBROTIC TISSUE LEFTOVER.
COMPLETE VISUAL REMOVAL OF FIBROTIC RESIDUE FROM THE SKIN EPITHELIUM.

TESTED & APPROVED

"Example of convincing case with a complicated and invasive Dupuytren causing a flexion of 90° of the PIP and 40° of the MP of a 5th ray.

Very good facilitation, objectified, of dissection between the epidermal plane and the fibrous cords. After release of these skin flaps, there is no leftover of this type of fabric while in conventional method, there are still some residues that may cause a recurrence"

Dr. Philippe Etienne

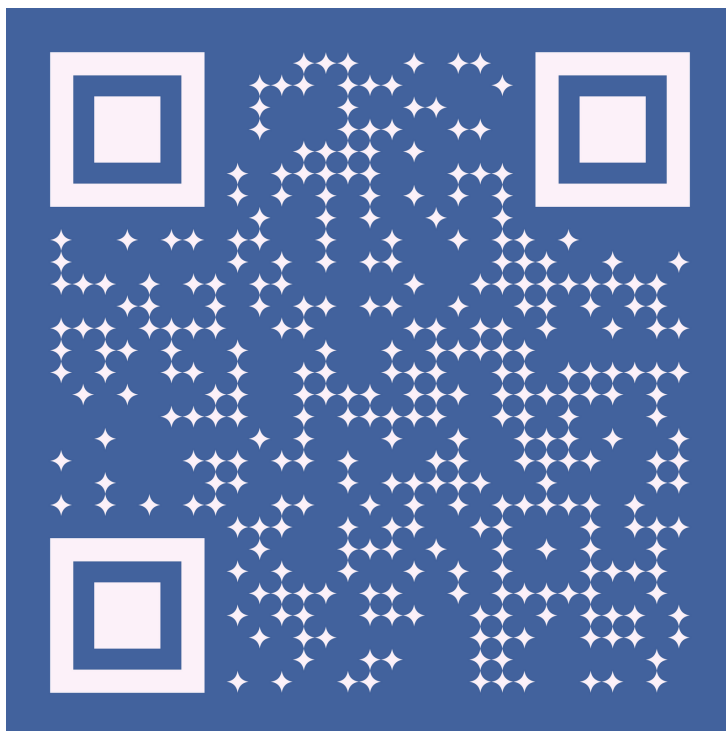

Upper limb surgery, traumatology, hospital Ambroise Paré - Mons, BE.
